

METAL SCRAP  
CUSTOMIZED CONVEYORS

**METAL SCRAP CONVEYING PIT INSTALLATIONS**

Pit installations are commonly used with high-tonnage presses with high scrap production outputs, normally with P=6" or P=10" conveyors.

The pit is placed under the press line and it is often provided with enough space along the conveyor for maintenance works.

These conveyors remove the scrap coming from the presses to the containers or trailers at the scrap collecting points inside or outside the building.

**FOCUSED TO**

High tonnage presses and high scrap production to be removed.

**PROVIDING**

- High reliability in the manufacturing process.
- Robustness on the scrap conveying.
- Cleanliness and tidiness at the facilities.
- Automation and minimization of the handling time.
